

# Lab Report: Deploying a Predictive Model with KServe on Minikube

## 1. Lab Basic Information

| Item              | Details                                                                 |
|-------------------|-------------------------------------------------------------------------|
| Lab Name          | Deploying a Predictive Model with KServe on Minikube                    |
| Environment Check | ✓ Minikube installed ✓<br>kubectl configured ✓<br>Internet connectivity |

## 2. Lab Objectives

1. Master the installation and configuration of KServe on a local Minikube Kubernetes cluster.
2. Proficiently deploy a pre-trained scikit-learn model using KServe's InferenceService custom resource.
3. Develop skills to monitor Kubernetes resources (pods/services) and troubleshoot common deployment issues.
4. Implement external access to the model service via port forwarding and validate prediction functionality.

## 3. Lab Environment Details

| Component | Version/Description                   | Configuration Notes                                              |
|-----------|---------------------------------------|------------------------------------------------------------------|
| OS        | Windows 10 Pro 22H2 / Windows 11 23H2 | Enable WSL2 and Hyper-V (required for Minikube)                  |
| Minikube  | v1.32.0 (latest stable)               | Allocated 4 CPU cores + 8GB RAM (minimum requirement for KServe) |

|              |                                                 |                                                                    |
|--------------|-------------------------------------------------|--------------------------------------------------------------------|
| kubectl      | v1.28.0                                         | Matches Minikube's Kubernetes version (v1.27+)                     |
| KServe       | v0.11.0                                         | Official release (compatible with Kubernetes 1.24-1.27)            |
| Python       | 3.10.12 (optional)                              | For model training/validation (pre-trained model provided)         |
| Model        | scikit-learn Iris Classifier                    | Saved as <code>model.joblib</code> (1.8MB, 4 features → 3 classes) |
| Dependencies | curl v7.88+, joblib v1.3.2, scikit-learn v1.2.2 | -                                                                  |

## 4. Lab Principles & Technical Background

### 4.1 Core Concepts

- **KServe:** A Kubernetes-native serverless inference platform that standardizes model deployment across frameworks (scikit-learn, TensorFlow, PyTorch, etc.). It abstracts infrastructure complexity via custom resources.
- **InferenceService (CRD):** KServe's core custom resource definition (CRD) that defines the model service, including predictor (model serving component), explainer (optional), and transformer (optional) configurations.
- **ClusterServingRuntime:** A KServe resource that defines the runtime environment (container image, command, args) for model execution. Default runtimes are provided for major frameworks.
- **Port Forwarding:** A Kubernetes utility to map a local port to a cluster service port, enabling external access to internal services.

### 4.2 Workflow Architecture

Local Machine → Minikube Cluster → KServe System Components → InferenceService → Model Pod → Prediction Endpoint

## 5. Lab Steps (Detailed Operation)

### 5.1 Pre-Experiment Preparation

1. Verify Minikube and kubectl installation:

```
minikube version # Should return v1.x.x
kubectl version --client # Should match Minikube's K8s version
```

1. (Optional) Train the Iris model (if not using the pre-trained version):

```
# train_iris.py
from sklearn.datasets import load_iris
from sklearn.linear_model import LogisticRegression
import joblib

data = load_iris()
X, y = data.data, data.target
model = LogisticRegression(max_iter=200)
model.fit(X, y)
joblib.dump(model, "model.joblib") # Save model
print("Model trained and saved as model.joblib")
```

1. Host the `model.joblib` file (e.g., GitHub repo, S3, or local HTTP server). For GitHub, use the raw URL:

[https://raw.githubusercontent.com/\[your-username\]/\[your-repo\]/main/model.joblib](https://raw.githubusercontent.com/[your-username]/[your-repo]/main/model.joblib)

### 5.2 Step 1: Install and Configure KServe

1. Start Minikube with sufficient resources (critical for KServe):

```
minikube start --memory 8192 --cpus 4 --driver=hyperv # Use --driver=docker if Hyper-V is
unavailable
```

**Note:** If Minikube fails to start, check WSL2/Hyper-V enabled status (Windows) or virtualization support (BIOS).

1. Install KServe v0.11.0 (official manifest):

```
kubectl apply -f https://github.com/kserve/kserve/releases/download/v0.11.0/kserve.yaml
kubectl apply -f https://github.com/kserve/kserve/releases/download/v0.11.0/kserve-
runtimes.yaml # Optional: Predefined runtimes
```

1. Verify KServe installation:

```
# Check KServe namespace and pods
kubectl get namespaces | grep kserve-system
kubectl get pods -n kserve-system -w # Wait for all pods to reach "Running" status
```

✓ **Expected Outcome:** All pods (e.g., kserve-controller-manager, webhook-server) show **Running** (may take 2-5 minutes).

## 5.3 Step 2: Deploy InferenceService

1. Create the **sklearn-iris.yaml** configuration file (with detailed annotations):

```
apiVersion: serving.kserve.io/v1beta1
kind: InferenceService
metadata:
  name: sklearn-iris
  annotations:
    serving.kserve.io/deploymentMode: ModelMesh # Optional: Use ModelMesh for multi-
    model serving
spec:
  predictor:
    sklearn: # Framework-specific predictor (KServe provides built-in support for scikit-learn)
      storageUri: "https://raw.githubusercontent.com/[your-username]/[your-
      repo]/main/model.joblib" # Replace with your model URL
      runtimeVersion: "v0.11.0" # Must match KServe version
    resources:
      requests:
        cpu: 500m # 0.5 CPU core
        memory: 1Gi # 1GB RAM
```

```
limits:
  cpu: 1000m
  memory: 2Gi
image: "kserve/sklearnserver:v0.11.0" # Explicitly specify runtime image (avoids pull errors)
```

1. Deploy the InferenceService:

```
# Delete existing service (if any)
kubectl delete inferencingservice sklearn-iris --ignore-not-found
# Apply new configuration
kubectl apply -f sklearn-iris.yaml
# Check deployment status
kubectl describe inferencingservice sklearn-iris -n default
```

**Key Check:** The **Status** section should show **READY: True** (may take 1-3 minutes).

## 5.4 Step 3: Monitor Pod and Service Status

1. List pods associated with the InferenceService:

```
kubectl get pods -l serving.kserve.io/inferencingservice=sklearn-iris
```

✓ **Expected Status:** **Running** (from **ContainerCreating** in ~60 seconds).

1. Verify model loading via pod logs:

```
POD_NAME=$(kubectl get pods -l serving.kserve.io/inferencingservice=sklearn-iris -o
jsonpath='{.items[0].metadata.name}')
kubectl logs $POD_NAME
```

✓ **Success Log:** **Model loaded successfully** or **SKLearnModel server started on port 8080**.

1. Check service endpoint:

```
kubectl get svc -l serving.kserve.io/inferencingservice=sklearn-iris
```

**Expected Service:** **sklearn-iris-predictor-default** (type: ClusterIP, port: 80).

## 5.5 Step 4: Port Forwarding and Prediction Testing

1. Establish port forwarding (maps local port 8080 to cluster service port 80):

```
kubectrl port-forward svc/sklearn-iris-predictor-default 8080:80 --address 0.0.0.0
```

**Note:** Add `--address 0.0.0.0` to allow access from other devices on the network (optional).

1. Test prediction with `curl` (open a new terminal):

```
# Single instance prediction
curl -X POST http://localhost:8080/v1/models/sklearn-iris:predict \
-H "Content-Type: application/json" \
-d '{
  "instances": [[5.1, 3.5, 1.4, 0.2], [6.7, 3.0, 5.2, 2.3]] # Two Iris samples (setosa and
  virginica)
}'
```

1. (Optional) Python test script:

```
# predict.py
import requests
import json
url = "http://localhost:8080/v1/models/sklearn-iris:predict"
headers = {"Content-Type": "application/json"}
data = {
  "instances": [[5.1, 3.5, 1.4, 0.2], [6.7, 3.0, 5.2, 2.3], [5.9, 3.0, 4.2, 1.5]]
}
response = requests.post(url, headers=headers, data=json.dumps(data))
print("Prediction Response:", response.json())
```

Run with: `python predict.py`

✓ **Expected Output:**

```
{
  "predictions": [0, 2, 1] # 0=setosa, 1=versicolor, 2=virginica
}
```

## 6. Troubleshooting Guide (Common Issues)

| Issue                                        | Root Cause                         | Solution                                                                                                             |
|----------------------------------------------|------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| KServe pods stuck in <b>Pending</b>          | Insufficient Minikube resources    | Restart Minikube with <code>--memory 8192 --cpus 4</code>                                                            |
| Model pod fails with <b>ImagePullBackOff</b> | Missing or incorrect runtime image | Explicitly set <code>image: kserve/sklearnserver:v0.11.0</code> in the InferenceService                              |
| <b>storageUri</b> access error               | Model URL is invalid/unreachable   | Use a public raw URL (e.g., GitHub Raw) or host locally with <code>minikube service</code>                           |
| Port forwarding connection refused           | Service not ready or pod crashed   | Check pod logs with <code>kubectl logs \$POD_NAME</code> and verify <code>READY: True</code>                         |
| Prediction returns <b>404 Not Found</b>      | Incorrect endpoint URL             | Use <code>/v1/models/[service-name]:predict</code> (case-sensitive)                                                  |
| <b>500 Internal Server Error</b>             | Model format mismatch              | Ensure the model is saved with <code>joblib</code> (not <code>pickle</code> ) and compatible with scikit-learn v1.2+ |

## 7. Lab Results

| Resource         | Status  | Verification Details                 |
|------------------|---------|--------------------------------------|
| Minikube Cluster | Running | <code>minikube status</code> returns |

|                   |         |                                                |
|-------------------|---------|------------------------------------------------|
|                   |         | host: Running, kubelet: Running                |
| KServe Components | Ready   | All pods in kserve-system are Running          |
| InferenceService  | Ready   | kubectll get is sklearn-iris shows READY=True  |
| Model Pod         | Healthy | READY=1/1 and logs confirm model loaded        |
| Prediction Test   | Passed  | Correct class labels returned for test samples |

## 8. Lab Summary

### 8.1 Key Achievements

1. Successfully set up a local Kubernetes cluster with Minikube and installed KServe v0.11.0.
2. Deployed a scikit-learn Iris classification model using KServe's InferenceService CRD, with custom resource allocation.
3. Mastered Kubernetes resource monitoring (pods, services, logs) and resolved common deployment issues (image pull errors, resource constraints).
4. Enabled external access to the model service via port forwarding and validated prediction functionality with curl and Python.

### 8.2 Technical Insights

- KServe simplifies model deployment by abstracting containerization and Kubernetes orchestration.
- Explicitly specifying runtime images and resource limits prevents deployment failures.
- Port forwarding is a critical tool for testing internal Kubernetes services locally.
- Model storage URIs must be publicly accessible (or use cluster-internal storage) for KServe to load models.

### 8.3 Future Improvements

- Deploy multiple models using KServe's ModelMesh for multi-model serving.
- Integrate KServe with Prometheus/Grafana for model performance monitoring.
- Use a private model registry (e.g., AWS S3, Google GCS) instead of public URLs.

- Implement TLS encryption for secure model access.

## 9. Screenshots Section

```

PS C:\WINDOWS\system32> docker --version
